

Basic Concepts & Principles

"Cutting the court down in size and gaining a numerical advantage."

Because basketball players spend most of their time and efforts developing and refining their offensive skills, they are usually very ill prepared defensively. Yet, despite having little or no defensive skills, coaches still expect their players to be able to go out and guard outstanding offensive opponents.

However, for them to be successful, players must first possess a working knowledge of the basic defensive concepts and fundamentals. These basic concepts include: Trap Zones, Red Zone, Pushpoints, Helpside I, and Box Pressure.

What you will learn:

- ★ The basic concepts and principles: Trap Zones, Red Zone and PushPoints. PP. 9 - 11
- ★ That the out of bounds lines are a defender's greatest ally. Pg. 9
- ★ The importance of keeping the ball handler out of the middle of the court. Pg. 11
- ★ About providing strong backside support. Pg. 12
- ★ How to cut the court down in size and box the offense into a corner. Pg. 14

Sideline

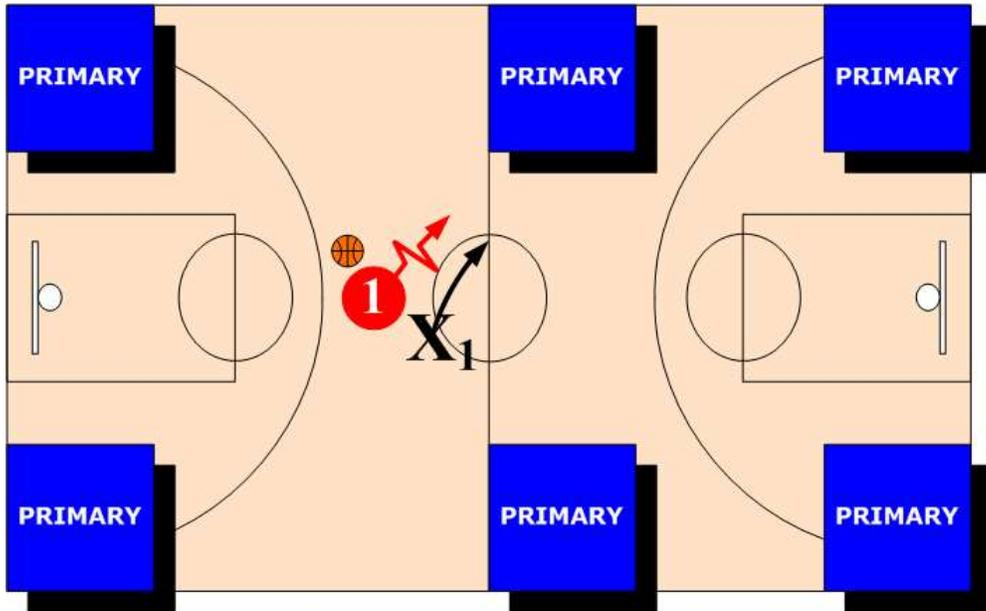

Trap Zones

Out of bounds lines are a defender's greatest ally.

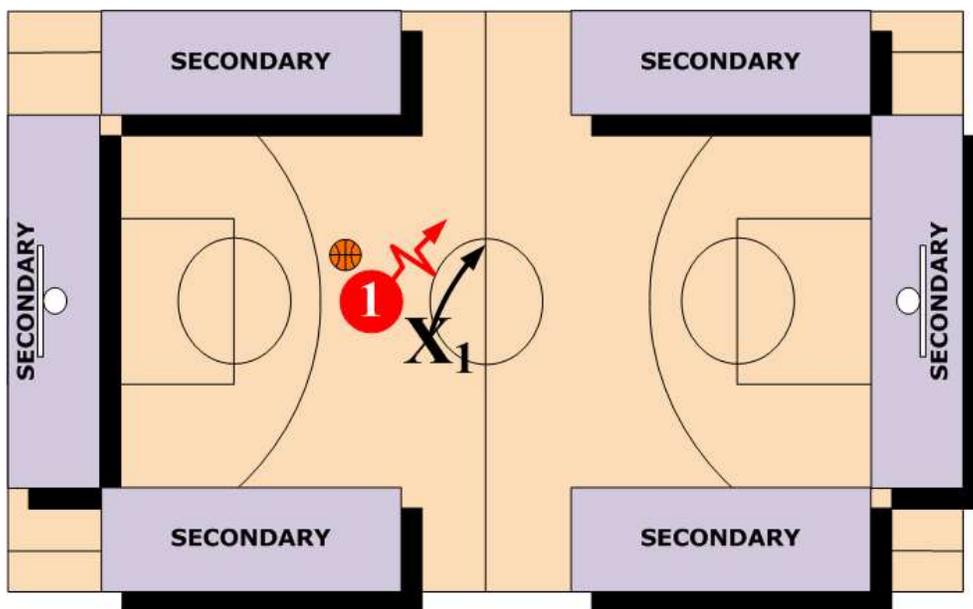

Out of bounds lines are tenacious defenders that never make a mistake. Defenders should take full advantage of the out of bounds lines to form trap zones. There are two types of trap zones: Primary and Secondary.

Primary Trap Zones

Primary trap zones are the corners of the court where the defense can take advantage of two lines to trap and lock up the offensive player. There are six primary trap zones. Two are in the back court and four are in the front court.

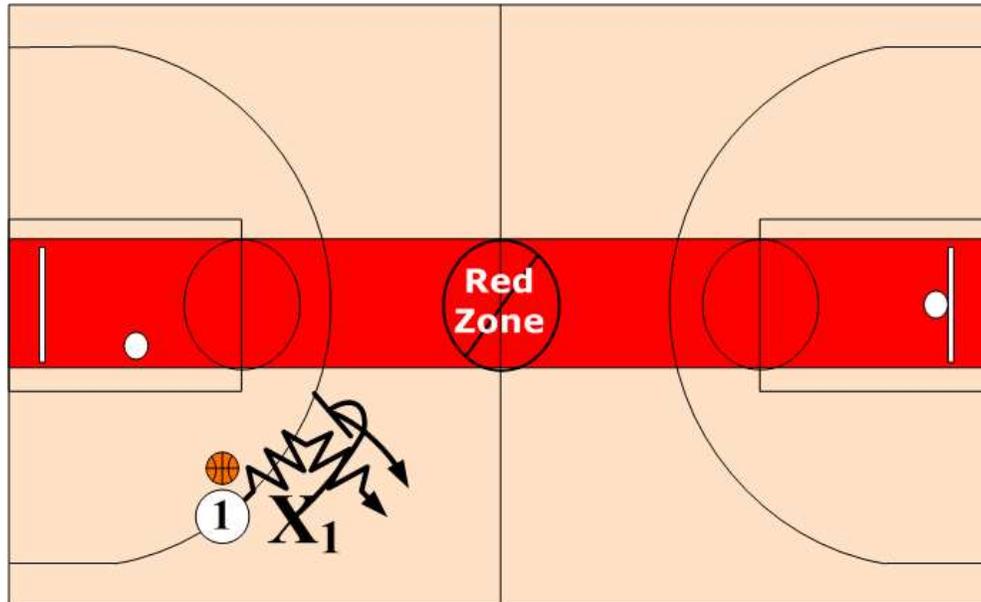

Secondary Trap Zones

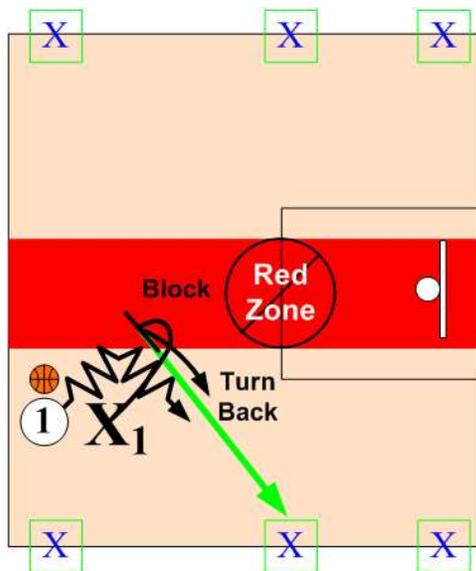

Secondary trap zones are the sideline or baseline locations where, defensively, one out of bounds line comes into play.

Red Zone – Sideline Push

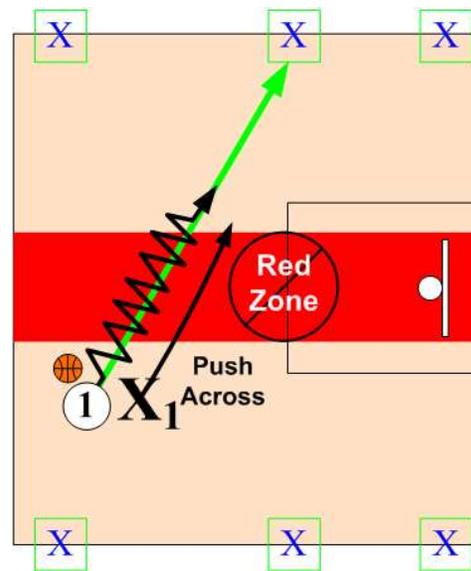

Keeping the Ball Out of the Middle

One of the most important principles of defense is to push the ball handler toward the sideline. In keeping the ball out of the middle it not only cuts down and minimizes the offensive operating area on the court, but it also establishes Helpside defensive support.

If the ball handler should penetrate into the middle, the defender should physically block and turn the dribbler back to the sideline.

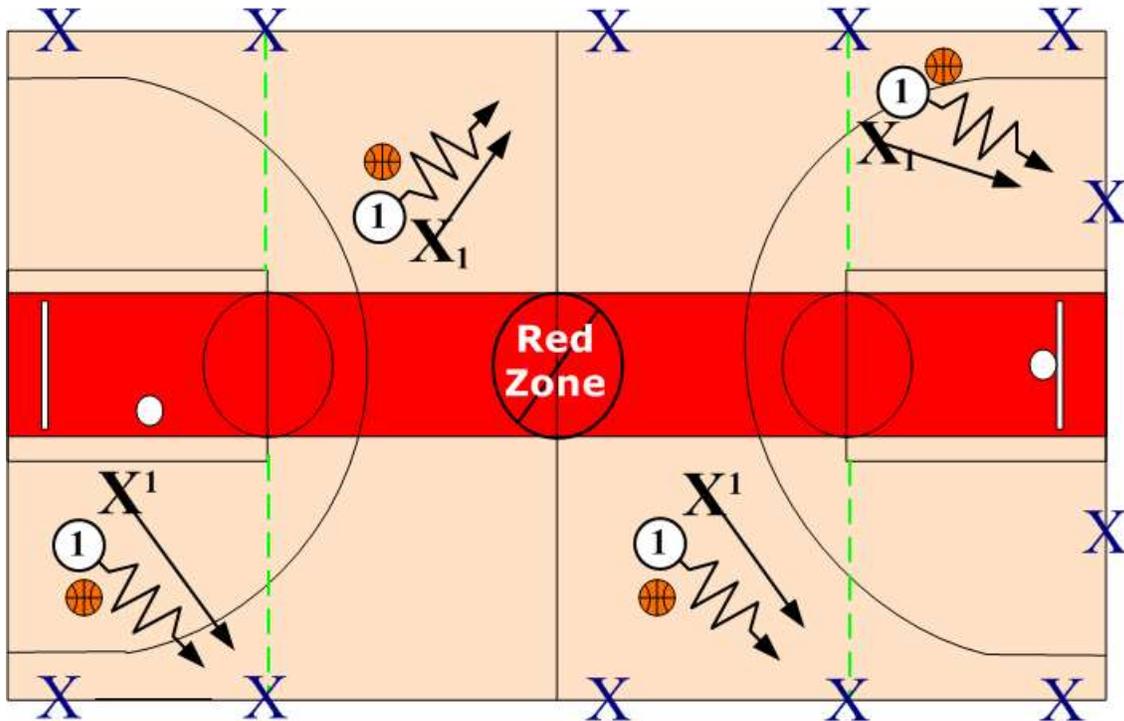

If/when the defender is unable to turn the ball handler, force the dribbler across the red zone to the opposite sideline.

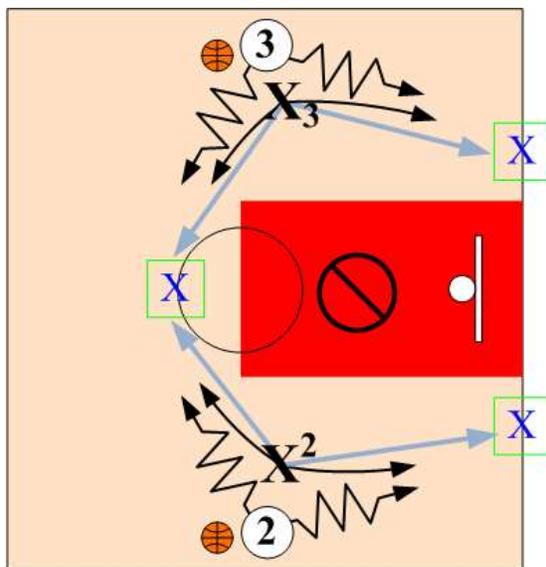

CAUTION

Defensively, nothing good ever happens on middle penetration – it's all bad. Dribbling up the middle usually results in a layup, drop pass for an easy shot, short pull up jumper or a kick out pass for an open three point shot.

PushPoints

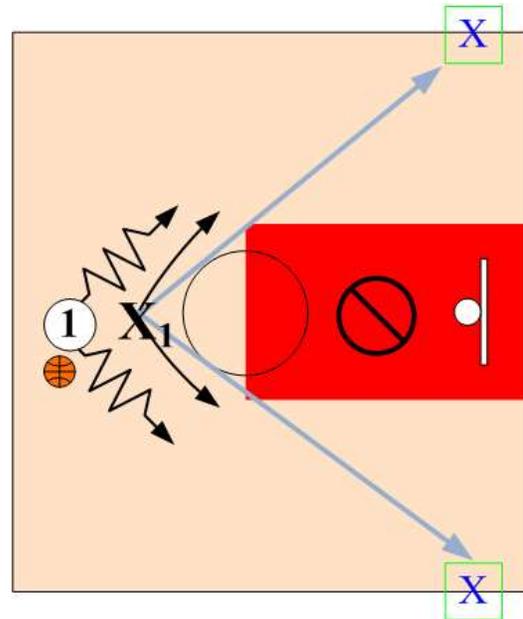

Pushpoints represent specific spots on the court for the defender to push or influence the opponent with the ball. These exact locations are along each sideline and baseline, and include the corners, free throw line extended, baseline and half court.

Ball On The Wing

When the ball is on the wing, the defender should make every attempt to push the ball handler below the block toward the baseline pushpoint. However, if/when the dribbler tries to drive into the middle of the floor, the defender should protect the elbow, and force the dribbler over the top of the circle.

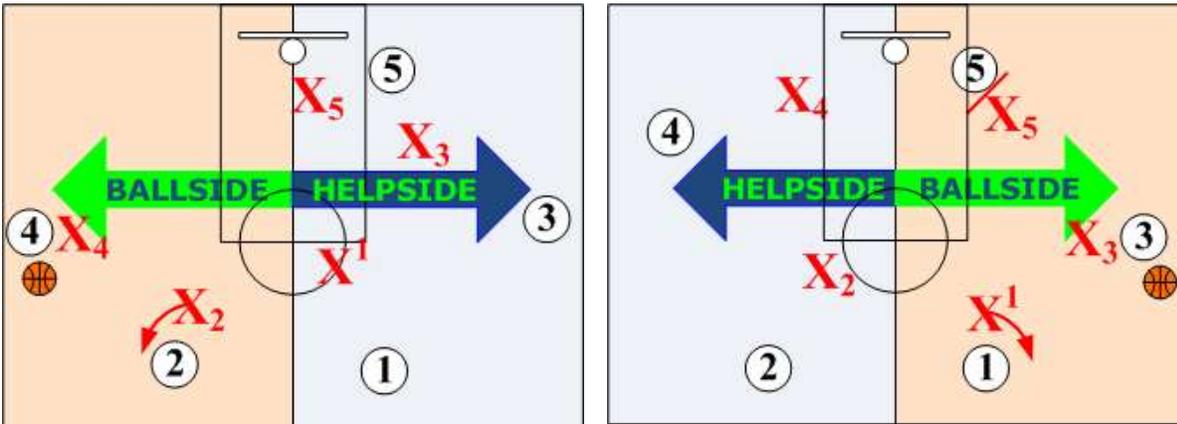

Ball At Top of Circle

When the ball is located in the high post area, the defender should make every attempt to protect the "Elbows" and push the ball handler towards a corner pushpoint.

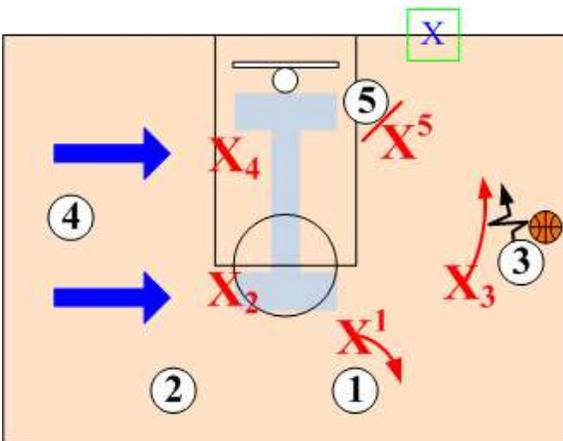

Helpside "I"

Providing Strong Backside Help

Defenders should be cognizant of their location in relationship to the ball handler at all times. By pressuring the ball handler to sideline "PushPoints," it enables the defensive players on the opposite side of the floor to sag off their opponents and establish strong, backside Helpside "I" positions.

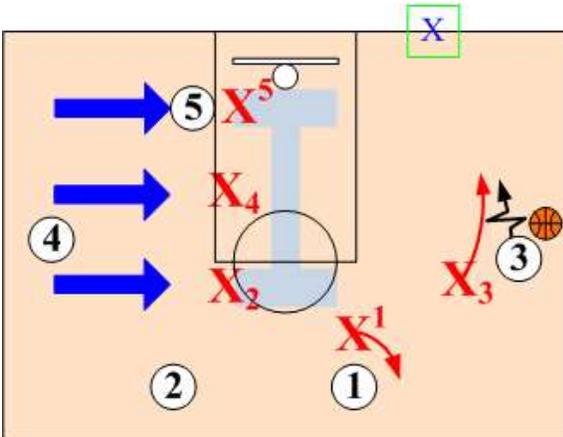

In assuming Helpside "I" positions, defenders can help out teammates, double team, deny ball cuts, take charges, and rebound. Helpside support also neutralizes any offensive player advantages along with eliminating all one-on-one isolations.

Double "I" (Low/High)

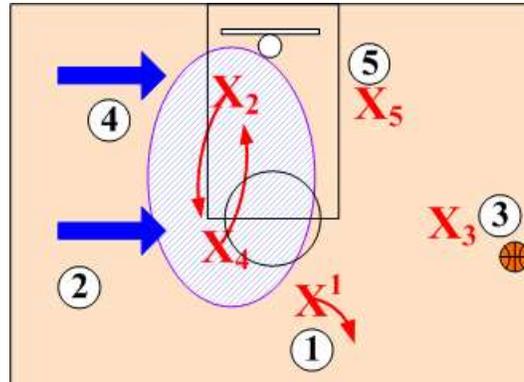

A Double Helpside "I" defensive alignment is created when the post is deployed on the ball side of the court. From this alignment two defensive (Low/High) players are in position to provide for strong defensive help.

Triple "I" (Low/Mid/High)

When the offense deploys the post on the side of the court away from the ball, it creates a Triple Helpside "I" defensive alignment. This alignment will allow three defensive (Low/Mid/High) players to provide defensive help. Any one of the three Helpside "I" players can rotate to trap.

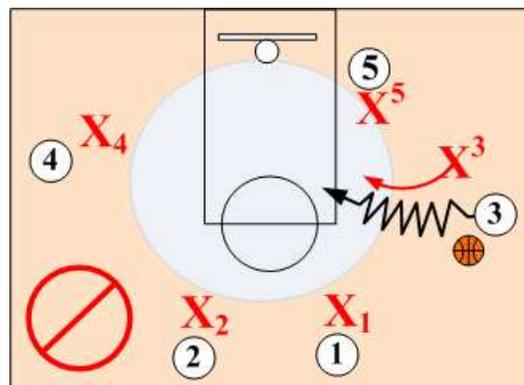

Inverting on Helpside

Size Mismatch

Players in the “Helpside I” positions should recognize when a big player is in a “High I” position and a smaller player is in a “Low I” position, and INVERT by interchanging positions whenever possible.

No Helpside Support

If/when the weakside defenders do not sag off into a Helpside “I” support positions, it opens up the entire middle of the court for dribble penetration. With such a large opening, ball handlers will actually be encouraged to drive into the middle, instead of being discouraged.

Box Pressure

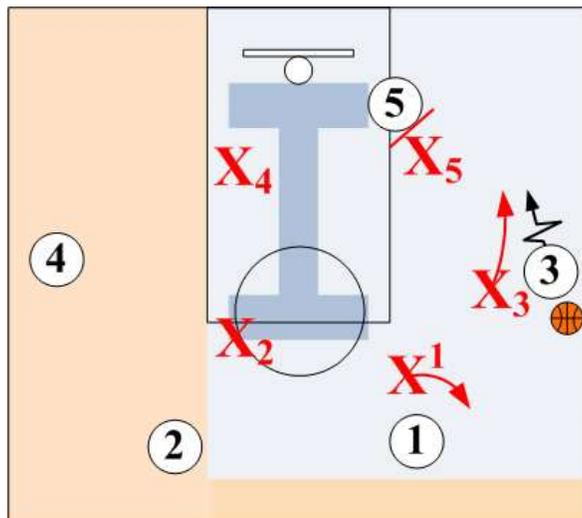

Cutting the Court Down in Size

Just like trying to catch a rabbit or chicken, if you chase after it or try to cut it off you are going to be unsuccessful. However, you will be successful in catching it if you herd it into a corner. Disruptive Pressure Defense works in a similar manner. By using sideline PushPoints along with preventing ball reversal, it will box the offense into a corner.

Boxing the offense into a corner takes a coordinated team effort. The defender guarding the player with the ball needs to push the ball handler to a sideline or baseline pushpoint, all of the weakside defenders must assume Helpside "I" positions, and, the reversal pass must be denied.

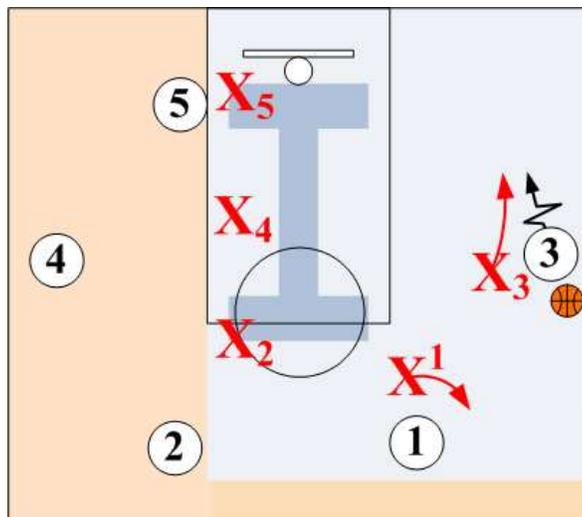

Once Box pressure is created, it doesn't only limit the area of the court that needs to be defended, but it also provides the defense with a significant numerical player advantage. If you count the baseline and sideline (two great defensive players that never make any mistakes) the numerical advantage becomes even bigger.

Five against Three Defensive Advantage

Boxing the opponent into the corner creates a 5 on 3 numerical advantage for the defense when the offensive post sets up on the ball side of the court.

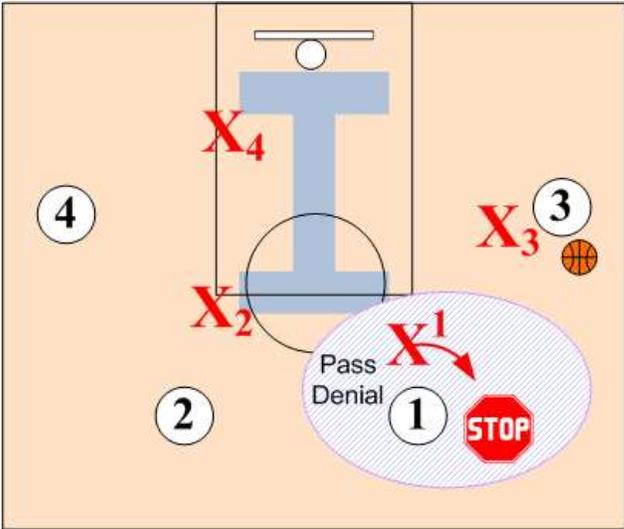

Five against Two Defensive Advantage

If/when the post assumes a weakside position, box pressure affords an even bigger advantage in creating a five (seven if you count the two out of bound lines) against two situation.

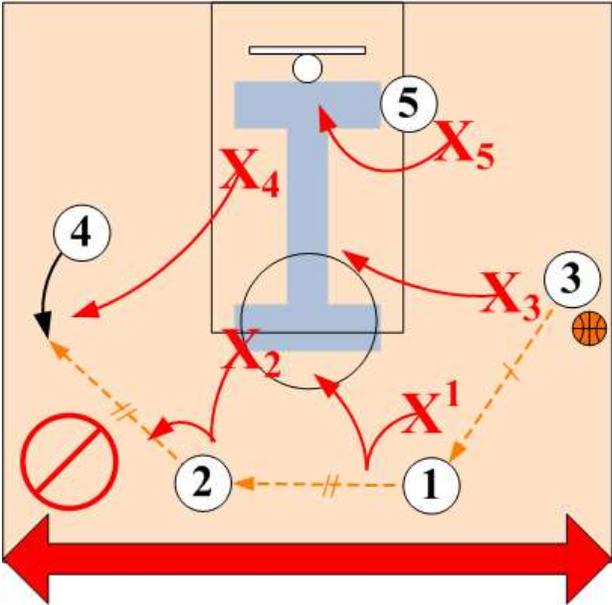

Preventing Ball Reversal

During ball reversal is the time that the defense is most vulnerable. All defenders must transition from either an "Off Ball" to an "On Ball" position or vice versa from an "On Ball" to an "Off Ball" position, exposing them to attack. This is why most offenses have quick hitting, weakside options, and why ball reversal is such a key ingredient of zone offenses.

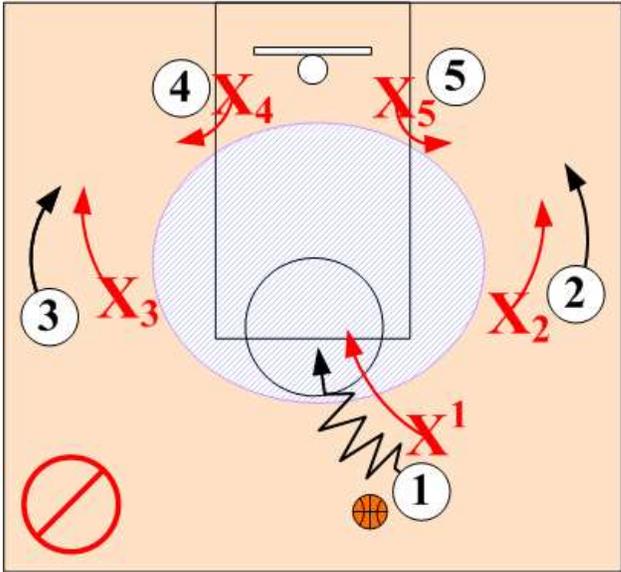

Preventing the ball reversal is the key to creating box pressure. In denying the ball reversal pass, it will force the ball handler into dribbling or making a difficult pass.

Ball Reversal

Allowing ball reversal forces the defense to defend the entire court (sideline to sideline).

Middle Penetration

Allowing dribble penetration into the "Red Zone" (Middle) also eliminates box pressure along with defensive help.

In Review

1. By employing a few basic defensive concepts Disruptive Pressure Defense can gain control of the game, and put the offense at a distinct disadvantage.
2. Defenders should take full advantage of the out of bounds lines to form primary and secondary trap zones.
3. Defenders should work hard to prevent dribble penetration down middle of the court by influencing their opponent to a sideline or baseline pushpoint.
4. In keeping the ball out of the middle of the court (“Red Zone”), it not only reduces the offensive operating area, but it also creates Helpside defense.
5. In assuming Helpside “I” positions, defenders can help out teammates, double team, deny ball cuts, take charges, and rebound.
6. When the weakside defenders do not sag off into Helpside “I” support positions, it opens up the entire middle of the court and actually encourages dribble penetration into the middle.
7. By using the sideline pushpoints along with preventing ball reversal, it allows the defense to box the offense into a corner.
8. Boxing the opponent into the corner of the court creates a numerical advantage for the defense.
9. Boxing the offense into a corner takes a coordinated team effort.
10. Preventing the ball reversal is key in maintaining box pressure.

CAUTION

Since players receive instruction from a variety of sources, it is very important that the entire coaching staff use the same offensive and defensive terms.

Basic Concepts Terminology

Box Pressure – Creating a numerical advantage for the defense by influencing the ball into the corner a corner of the court.

Primary Trap Zone – Corners of the court where the defense can take advantage of two lines.

Secondary Trap Zone – Sideline or baseline locations on the court where one out of bounds line comes into play.

Red Zone – The middle of the court.

Pushpoints – Specific spots along the sideline and baseline for the defender to push or influence the opponent with the ball.

Helpside I – Weakside defensive players sagging off their opponents and establishing strong backside support.
